Client Requirement

Backend Developer for Software Integration

Overview

I'm looking for a backend developer to assist with a pre-built application. The role involves testing functionality to ensure everything works correctly, adding any missing components, completing the development to its full potential, and providing integration support.

Scope of work

Scope of work

1. Application Review & Assessment
   - Analyze the existing backend architecture and codebase.
   - Identify incomplete features, missing components, and performance gaps.
   - Review database structure and API integrations.
2. Testing & Quality Assurance
   - Test all backend functionalities to ensure proper performance.
   - Identify and fix bugs, errors, and inconsistencies.
   - Validate data flow, security, and system stability.
3. Feature Completion & Enhancement
   - Develop and implement any missing features.
   - Optimize existing logic and improve efficiency.
   - Ensure the application reaches full operational capacity.
4. Integration Support
   - Assist with third-party API integrations.
   - Ensure seamless communication between frontend and backend systems.
   - Provide support for deployment and environment configuration.
5. Documentation & Handover
   - Document code updates and system architecture changes.
   - Provide technical guidance for future maintenance.
   - Support know

Developer expertise

Algorithms & Data structures, Operating systems, Security, Performance, Design

My Proposal :

Hi, I'd be happy to assist with backend integration and optimization of your pre-built application. As a full-stack developer with strong backend experience, I specialize in system integrations, API connectivity, database optimization, and performance tuning. Here's how I can help:
• Seamless integration of your application with third-party systems (REST APIs, webhooks, authentication flows, etc.)
• Debugging and resolving integration-related issues
• Database query optimization and backend performance improvements
• Security hardening and scalability improvements
• Clean documentation for long-term maintainability Before we begin, I would need:
• Access to the backend repository (GitHub/GitLab/Bitbucket)
• API documentation of systems to be integrated
• Server/environment access (if deployment-level changes are needed)
• Clear understanding of current bottlenecks or issues
Let's discuss your current architecture and integration goals so I can propose the best technical approach.
Looking forward to working with you.
Best regards,
Muhammad Haroon

oppyogun

I have a EHS application I'm working on

I'm almost done, just need to be in full 100 percent completed but will need a technical backend person for fixing bugs, blanks and adding more details.

Also help with integration

Me

Thanks for sharing the details about your EHS application. I'd be happy to help you finalize it and bring it to 100% completion. I have strong backend experience in debugging, optimizing logic, filling incomplete modules, and handling system integrations.

To better understand the scope, could you please share: 1. The current tech stack (backend language & database)? 2. What integrations are required? 3. A list of known bugs or pending tasks? Once I review the details, I can give you a clear timeline and cost estimate.

oppyogun

Hono and **Drizzle ORM**

No integration needed now because I don't have a client yet

I built the app on youware AI

To be honest I just feel, I still need to add more details to make it perfect

But we will have to sign NDA to move forward

Me

Thank you for the clarification.

Hono with Drizzle ORM is a solid stack — I'm comfortable working with it.

Since there's no integration required at this stage, we can focus on refining the backend structure, improving logic, filling in missing details, optimizing database models, and ensuring the application is production-ready. I'm also fine with signing an NDA before proceeding — that's completely understandable. Please share your NDA draft, or I can provide one if needed.

oppyogun

Perfect and thank you for understanding my vision

https://ehs-platform.youware.app

This what it looks like now,

Please can if you can provide one that fine and we can both sign it. Thanks Muhammad

Me

I've reviewed the current structure, and you've built a solid foundation using Youware AI. With proper backend refinement and structural improvements, we can definitely elevate it to a production-ready level.you can share NDA Doc i will read and sign
After that, I suggest the following next steps: 1. Full backend code review 2. Identify gaps, logic improvements, and structural optimizations 3. Create a structured enhancement

roadmap 4. Begin staged improvements with clear milestones Once the NDA is signed, you can share repository access and we'll move forward securely.

oppyogun

I'm sorry, I don't have an NDA on me now. Can you provide one ?

Me

morning time i will provide

oppyogun

Looks good, I saw 2 years please can you explain the short team on a NDA.

Me

The 2-year term simply means that both parties agree to keep shared confidential information protected for two years after signing the agreement. This is a standard duration commonly used in software and freelance projects.

oppyogun

I know but information should be kept confidential forever. Please if you remove the 2 years, I will be comfortable.

https://www.youware.com

Okay let's go to youware

Me

I am checking

After reviewing the backend structure carefully, I've identified several core areas that need improvement before the system can be considered production-ready. Key observations: 1. The application currently lacks persistent data storage, meaning incident reports and training records are not being permanently saved.
2. The AI assistant integration is misconfigured, causing chat and suggestion features to fail

due to incorrect service communication.
3. The AI response handling is too rigid, which causes the system to break if responses are not formatted in a specific structure.
4. The email notification system does not properly validate message completion before sending.
5. There is limited backend logging and error visibility, making it difficult to detect service failures.
6. Some safety features are currently relying on placeholder/mock data rather than real processed data. These are not surface-level bugs but structural improvements that will significantly strengthen the stability and reliability of the platform. I recommend we address these in structured phases to ensure the foundation is solid before adding more features. Let me know how you would like to proceed, and I can outline a prioritized action plan.

oppyogun

Okay let's do that

Me

Based on the technical review, I suggest we approach this in structured phases to ensure the platform becomes stable, reliable, and production-ready.

🔷 Phase 1 – Core Stability & Data Foundation Goal: Make the system actually functional and persistent. Scope:
• Implement proper persistent database storage (incident reports, training records, logs)
• Replace placeholder/mock data with real processing logic
• Add backend validation layers • Implement structured error handling & logging system
• Ensure environment configuration is properly secured Outcome: A stable backend foundation where real data is stored and processed correctly. Estimated Time: 4–6 days 🔷

Phase 2 – AI & Service Integration Fixes Goal: Make AI assistant reliable and intelligent. Scope:
• Fix AI service communication (correct request/response handling)
• Build flexible response parser (no rigid formatting dependency)
• Add fallback handling if AI fails
• Add service health checks
• Improve suggestion & chat stability Outcome: AI assistant works reliably without crashing. Estimated Time: 3–5 days

🔷 **Phase 3 – Email, Monitoring & Production Readiness Goal: Make system safe for real users. Scope:**

- **Fix email validation before sending**
- **Add structured logging for service failures**
- **Add basic monitoring visibility**
- **Clean architecture refactoring where needed**
- **Final system testing Outcome: Production-ready backend with stability and visibility.**

Estimated Time: 3–4 days

oppyogun

Okay

Me

Tell me your timeline and budget

oppyogun

One month. 0dollars

Or just give me you number and we can work on the budget

Me

Ok but that's too much low budget

oppyogun

Okay give me an amount

Me

I can see you’ve built a solid foundation on Youware AI and the idea behind the platform is impressive. Based on the technical review and the improvements needed, the standard rate for such backend work typically ranges between $0 – $0. However, since you’re a new client

and I really value the opportunity to collaborate, I can offer a special rate of $0 for this project. This will cover all three phases of improvements — Core Stability, AI & Service Fixes, and Email/Monitoring enhancements — and ensures a stable, production-ready system.

oppyogun12345_

We can do 0. This will make us collaborate more, I'm passionate about this and can help us build a better partnership

Me

I really appreciate your passion and your focus on building a strong collaboration — that's exactly the kind of client relationship I value as well. Considering the complexity of the backend improvements and the work involved, the minimum I can do while ensuring the system is fully production-ready is $650. This covers all three phases: Core Stability, AI & Service Fixes, and Email/Monitoring enhancements. I'm confident this will give us a solid foundation and a successful collaboration, and we can continue to build on it together.

oppyogun

0 and we have a deal

Me

Since this would extend the scope beyond the original backend improvements, I can adjust the proposal accordingly once I understand the exact requirements.
However, integrating Google Workspace properly is not just a small addition — it involves secure authentication setup, API configuration, permissions management, and production-level error handling to make it reliable and scalable.

oppyogun

One sec pls
The google workspace, is just for my LLc, safetyMeg. Like for u and me and for sales and marketing and and move things on there and to coordinate better

Me

That makes sense — using Google Workspace for SafetyMeg's internal coordination and growth is a smart move.

Since this is more of a business infrastructure setup rather than application integration, we can treat it as a separate setup service.

I can handle:

- Workspace domain configuration
- User setup & permissions
- Gmail configuration
- Shared Drive structure
- Basic security configuration

oppyogun
Sweet
Yes please, thanks
So let's work
How can we move forward
Yes

Me
This way, your company infrastructure is properly organized and secure from the beginning.
That's Extra Work

Because:

- It's not simple "click next next finish"
- DNS + MX records mistakes can break email
- Security misconfiguration risky
- I Provide professional IT support

oppyogun
I understand, that's why we talking right,
I do work in IT but risk , I have a BSC in information tech and master in environmental engineering

I have a crisc and Comptia
I understand your language sir

Me:
I respect that — and that makes collaboration even better.

With your IT and risk background, you already understand how important proper architecture, security configuration, and scalability are from the beginning.

My goal isn't to oversell anything — it's to make sure we build this correctly and avoid technical debt later.

For the Google Workspace setup, since this is more about structuring SafetyMeg's operational infrastructure, we can treat it as a separate implementation task.

Let me know how you'd like to structure it — we can align technically and move efficiently.

oppyogun:
I'm okay 👍
When can we start nd I can only afford

Me
Done
